Signal Without Strategy v1.1 — Figures

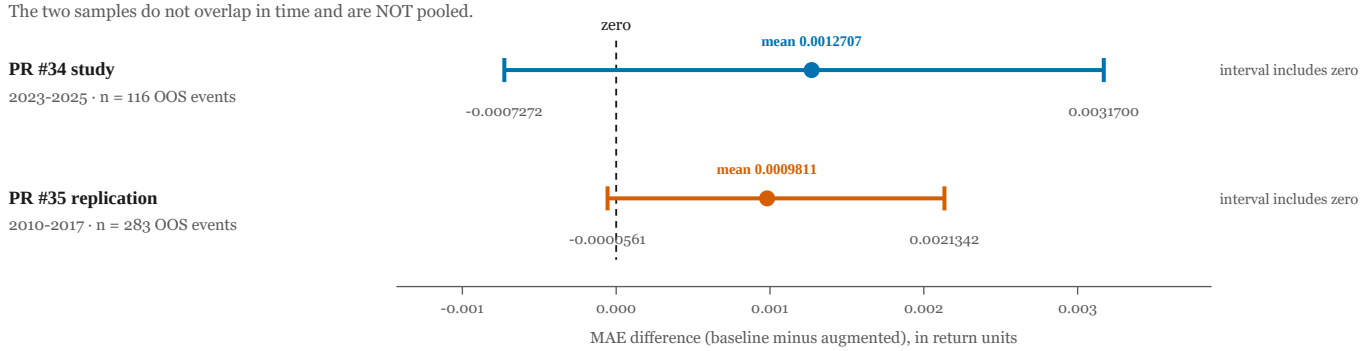
Figure 1. Evidence ladder

Each study is placed at the highest level its evidence actually supports, not the level it was designed to reach.
No study in this program reached Level 3.

Figure 1. Evidence ladder. Attention clears rung 1 (matched association, +2.0797 pp, p = 0.00397) and fails rungs 2 and 3 (incremental contribution +0.0131 pp, p = 0.98332; no out-of-sample forecast improvement). Clearing rung 1 does not establish rungs 2 or 3.

Figure 2. Earnings-surprise replication: MAE difference (baseline minus augmented)

Positive means adding vendor-defined earnings surprise reduced out-of-sample forecast error.
Bars are 95% moving-block bootstrap intervals (2,000 draws, 28-day blocks, seed 20260817).
The two samples do not overlap in time and are NOT pooled.



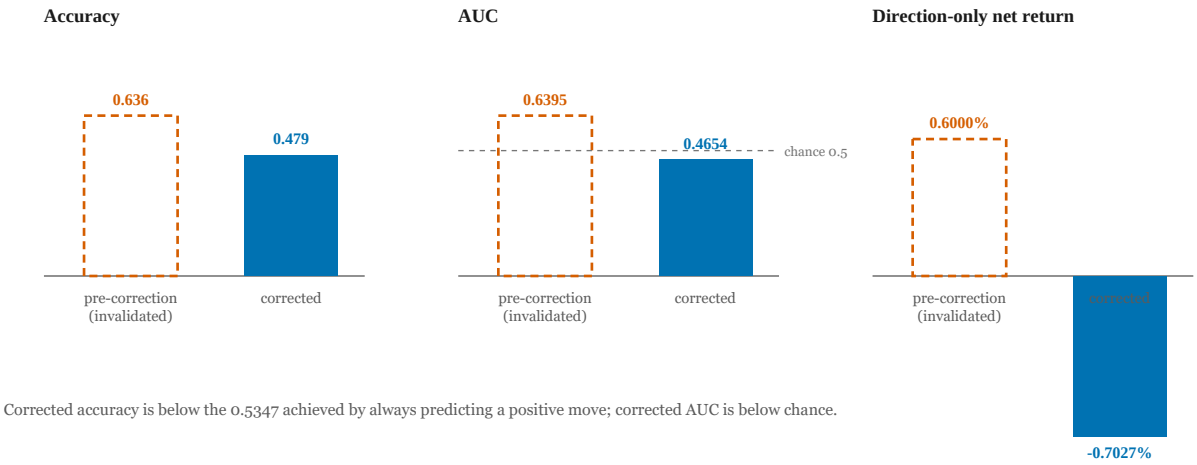
Both intervals include zero, so both windows failed the same unchanged uncertainty gate.

Figure 2. Earnings-surprise temporal replication. Retained unchanged from v1.0; no underlying value was recomputed.

Figure 3. Leakage correction in the directional model

Before correction: 68 duplicated rows among 285, and a lag feature reading the same event's own outcome.
After correction: 217 unique event identities and a corrected feature.

The pre-correction values are INVALIDATED. They are shown only to size the distortion, never as results.



Corrected accuracy is below the 0.5347 achieved by always predicting a positive move; corrected AUC is below chance.

Figure 3. Leakage correction: an apparent 63.6% directional accuracy fell to 47.9% after duplicated events and a mis-specified lag feature were corrected.
